Artificial intelligence Interview Questions And Answers

Artificial intelligence Job Interview Preparation Guide.

Question # 1
What is AI?
Answer:-
Artificial intelligence ("AI") can mean many things to many people. Much confusion arises that the word 'intelligence' is ill-defined. The phrase is so broad that people have found it useful to divide AI into two classes: strong AI and weak AI. Read More Answers.

Question # 2
What is the difference between strong AI and weak AI?
Answer:-
Strong AI makes the bold claim that computers can be made to think on a level (at least) equal to humans. Weak AI simply states that some "thinking-like" features can be added to computers to make them more useful tools... and this has already started to happen (witness expert systems, drive-by-wire cars and speech recognition software). What does 'think' and 'thinking-like' mean? That's a matter of much debate. Read More Answers.

Question # 3
I am a programmer interested in AI. I am writing a game that needs AI. Where do I start?
Answer:-
It depends what the game does. If it's a two-player board game, look into the "Mini-max" search algorithm for games (see [4-1]). In most commercial games, the AI is a combination of high-level scripts and low-level efficiently-coded, real-time, rule-based systems. Often, commercial games tend to use finite state machines for computer players. Recently, discrete Markov models have been used to simulate unpredictable human players (the buzzword compliant name being "fuzzy" finite state machines). A recent popular game, "Black and White", used machine learning techniques for the non-human controlled characters. Basic reinforcement learning, perceptrons and decision trees were all parts of the learning system. Is this the beginning of academic AI in video games? Read More Answers.

Question # 4
What is an agent?
Answer:-
A very misused term. Today, an agent seems to mean a stand-alone piece of AI-ish software that scours across the internet doing something "intelligent." Russell and Norvig define it as "anything that can be viewed a perceiving its environment through sensors and acting upon that environment through effectors." Several papers I've read treat it as 'any program that operates on behalf of a human,' similar to its use in the phrase 'travel agent'. Marvin Minsky has yet another definition in the book 'Society of Mind.' Minsky's hypothesis is that a large number of seemingly-mindless agents can work together in a society to create an intelligent society of mind. Minsky theorizes that not only will this be the basis of computer intelligence, but it is also an explanation of how human intelligence works. Andrew Moore at Carnegie Mellon University once remarked that "The only proper use of the word 'agent' is when preceded by the words 'travel', 'secret', or 'double'.' Read More Answers.

Question # 5
What has AI accomplished?
Answer:-
Quite a bit, actually. In 'Computing machinery and intelligence.', Alan Turing, one of the founders of computer science, made the claim that by the year 2000, computers would be able to pass the Turing test at a reasonably sophisticated level, in particular, that the average interrogator would not be able to identify the computer correctly more than 70 per cent of the time after a five minute conversation. AI hasn't quite lived up to Turing's claims, but quite a bit of progress has been made, including:
- Deployed speech dialog systems by firms like IBM, Dragon and Lernout&Hausspie
- Financial software, which is used by banks to scan credit card transactions for unusual patterns that might signal fraud. One piece of software is estimated to save banks $500 million annually.
- Applications of expert systems/case-based reasoning: a computerized Leukemia diagnosis system did a better job checking for blood disorders than human experts.

Question # 6
What are the branches of AI?

Answer:-
There are many, some are "problems" and some are "techniques".
Automatic Programming - The task of describing what a program should do and having the AI system "write" the program.
Bayesian Networks - A technique of structuring and inferencing with probabilistic information. (Part of the "machine learning" problem).
Constraint Satisfaction - solving NP-complete problems, using a variety of techniques.
Knowledge Engineering/Representation - turning what we know about particular domain into a form in which a computer can understand it.
Machine Learning - Programs that learn from experience or data.
Natural Language Processing (NLP) - Processing and (perhaps) understanding human ("natural") language. Also known as computational linguistics.
Neural Networks (NN) - The study of programs that function in a manner similar to how animal brains do.
Planning - given a set of actions, a goal state, and a present state, decide which actions must be taken so that the present state is turned into the goal state.
Robotics - The intersection of AI and robotics, this field tries to get (usually mobile) robots to act intelligently.
Speech Recognition - Conversion of speech into text.

Question # 7
What are good programming languages for AI?

Answer:-
This topic can be somewhat sensitive, so I'll probably tread on a few toes, please forgive me. There is no authoritative answer for this question, as it really depends on what languages you like programming in. AI programs have been written in just about every language ever created. The most common seem to be Lisp, Prolog, C/C++, recently Java, and even more recently, Python.
LISP - For many years, AI was done as research in universities and laboratories, thus fast prototyping was favored over fast execution. This is one reason why AI has favored high-level languages such as Lisp. This tradition means that current AI Lisp programmers can draw on many resources from the community. Features of the language that are good for AI programming include: garbage collection, dynamic typing, functions as data, uniform syntax, interactive environment, and extensibility.
Read Paul Graham's essay, "Beating the Averages" for a discussion of some serious advantages:
PROLOG - This language wins 'cool idea' competition. It wasn't until the 70s that people began to realize that a set of logical statements plus a general theorem prover could make up a program. Prolog combines the high-level and traditional advantages of Lisp with a built-in unifier, which is particularly useful in AI. Prolog seems to be good for problems in which logic is intimately involved, or whose solutions have a succinct logical characterization. Its major drawback (IMHO)

Question # 8
What is the difference between classical AI and statistical AI?

Answer:-
Statistical AI, arising from machine learning, tends to be more concerned with "inductive" thought: given a set of patterns, induce the trend. Classical AI, on the other hand, is more concerned with "deductive" thought: given a set of constraints, deduce a conclusion. Another difference, as mentioned in the previous question, is that C++ tends to be a favourite language for statistical AI while LISP dominates in classical AI.
A system can't be truly intelligent without displaying properties of both inductive and deductive thought. This lends many to believe that in the end, there will be some kind of synthesis of statistical and classical AI.

Question # 9
What are the best graduate schools for AI?

Answer:-
The short answer is: MIT, CMU, and Stanford are historically the powerhouses of AI and still are the top 3 today.
There are however, hundreds of schools all over the world with at least one or two active researchers doing interesting work in AI. What is most important in graduate school is finding an advisor who is doing something YOU are interested in. Read about what's going on in the field and then identify the the people in the field that are doing that research you find most interesting. If a professor and his students are publishing frequently, then that should be a place to consider.

Question # 10
What are partial, alternate, artificial, compound and natural key?

Answer:-
It is a set of attributes that can uniquely identify weak entities and that are related to same owner entity. It is sometime called as Discriminator.
Alternate Key:
All Candidate Keys excluding the Primary Key are known as Alternate Keys.
Artificial Key:
If no obvious key, either stand alone or compound is available, then the last resort is to simply create a key, by assigning a unique number to each record or occurrence. Then this is known as developing an artificial key.
Compound Key:
If no single data element uniquely identifies occurrences within a construct, then combining multiple elements to create a unique identifier for the construct is known as creating a compound key.
Natural Key:
When one of the data elements stored within a construct is utilized as the primary key, then it is called the natural key.

**Question # 12**
Explain Game Playing AI?

**Answer:**
This covers a number of game playing techniques, notably checkers and backgammon because so much good research has been done on these problems and because so many different techniques have been tried.

**Question # 13**
This set of Artificial Intelligence MCQs focuses on "Game Theory - 1".

1. General games involves,
   a) Single-agent
   b) Multi-agent
   c) Neither a nor b
   d) Only a and b

**Answer:**
   d) Only a and b
Explanation: Depending upon games it could be single agent (Sudoku) or multi-agent (Chess)

[Read More Answers](#).

**Question # 14**
Adversarial search of problems uses,

a) Competitive Environment
b) Cooperative Environment
c) Neither a nor b
d) Only a and b

**Answer:**
   a) Competitive Environment
Explanation: Since in cooperative environment agents' goals are in conflicts. They compete for goal.

[Read More Answers](#).

**Question # 15**
Mathematical game theory, branch of economics, views any multi-agent environment as a game provided that the impact of each agent on the others is "significant," regardless of whether the agents are cooperative or competitive.

a) True
b) False

**Answer:**
   a) True
[Read More Answers](#).

**Question # 16**
Zero sum games are one in which there are two agents whose actions must alternate and in which the utility values at the end of the game are always the same.

a) True
b) False

**Answer:**
   b) False
Explanation: Utility values are always same and opposite.

[Read More Answers](#).

**Question # 17**
Zero sum game has to be _______ game.

a) Single player
b) Two player
c) Multiplayer
d) Three player

**Answer:**
c) Multiplayer
Explanation: Zero sum games could be multiplayer games as long as the condition for zero sum game is satisfied

**Question # 18**
Initial state and the legal moves for each side define the _________ for the game.
a) Search Tree  
b) Game Tree  
c) State Space Search  
d) Forest  

**Answer:**  
b) Game Tree  

**Explanation:**  
An example of game tree for Tic-Tac-Toe game.

**Question # 19**  
Minimax algorithm (Figure 6.3) computes the minimax decision from the current state. It uses a simple recursive computation of the minimax values of each successor state, directly implementing the defining equations. The recursion proceeds all the way down to the leaves of the tree, and then the minimax values are backed up through the tree as the recursion unwinds.  
a) True  
b) False  

**Answer:**  
a) True  

**Explanation:** Refer definition of minimax algorithm.  

Read More Answers.  

**Question # 20**  
Complexity of minimax algorithm is  
a) Same as of DFS  
b) Space - bm and time - bm  
c) Time - bm and space - bm  
d) Same as BFS  

**Answer:**  
a) Same as of DFS  
b) Space - bm and time - bm  

**Explanation:** Same as DFS

**Question # 21**  
How effectiveness of the alpha-beta pruning gets increased?  
a) Depends on the nodes  
b) Depends on the order in which they are executed  
c) Both a & b  
d) None of the mentioned  

**Answer:**  
a) Depends on the nodes

**Question # 24**  
Tell me about AI Backgammon?  

**Answer:**  
This section looks at Berliner's program, two backprop versions by Tesauro and a temporal difference method by Tesauro. This latter program is VERY good and has found strategies that now human backgammon players acknowledge are better than some of the old humanly devised strategies.  

Read More Answers.  

**Question # 25**
Consider this: after a while Tesuaros temporal difference program will likely stop learning, so does this mean that it lost its intelligence?

Answer:
Some game playing programs are getting quite good and I expect that in the long run all the best "players" will be programs. While that is wonderful and while those programs that learn to play their games get a rating of minimal intelligence from me remember that what's impressive about people is that not only can they do games, they do heuristic search, theorem proving, use natural language and cope with the real world. The real challenge is to get programs to do that. If you simply pursue techniques for game playing will you ever end up with all these human capabilities in one program?

Question # 26
Explain AI Checkers?

Answer:
The main programs here are Arthur Samuel's, the rote learning method which is a lot like a memory based method, generalization learning which is a lot like backprop and a signature table approach that also gives you a feed-forward type network. One of Samuel's programs did beat a checkers champion and the AI community has often make a fuss over that saying that this AI program played a "championship-level" game however that expert beat the program in the next 6 games. Note too, what Samuels says; "the program is quite capable of beating any amateur player and can give better players a good contest".
